CS History: Lynn Conway

- Computer Scientist, Electrical Engineer and Transgender Activist born in 1938
- At Xerox Park, worked on *multi-project wafers*, which allowed printing multiple circuit designs on a single silicon wafer
- Co-authored *Introduction to VSLI Systems* in 1981, which became the standard textbook in chip design
- In 1983, developed the *Metal Oxide Semiconductor Implementation Service* system, an internet-based system for rapid-prototyping and small-run fabrication of new chip designs
  - Allowed academics and small businesses to develop their own chips for the first time

Adding Conditional Branching

- Want to be able to support beq, bne, etc
- Need to be able to check equality
- If a = b, then a − b = 0

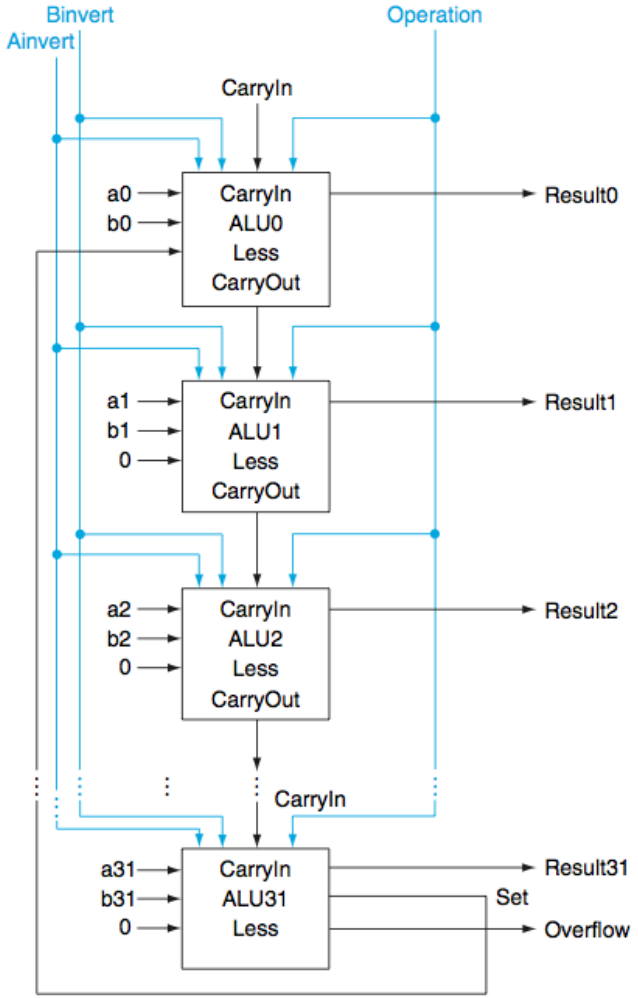
Detect 0 in Multi-bit ALU

- Subtract a − b

- Take output from each 1-bit ALU
  - If they are equal, all outputs should be 0

We know Result0-Result31 are all 0 if we perform a ___ operation on Result0 though Result31, and it outputs ___

A. AND, 0
B. OR, 0
C. NAND, 1
D. XOR, 0
E. None of the above



Detect 0 in Multi-bit ALU

- Subtract a − b
- Take output from each 1-bit ALU
- OR outputs together
  - If any output is 1, result will be 1, else 0
- Negate the result

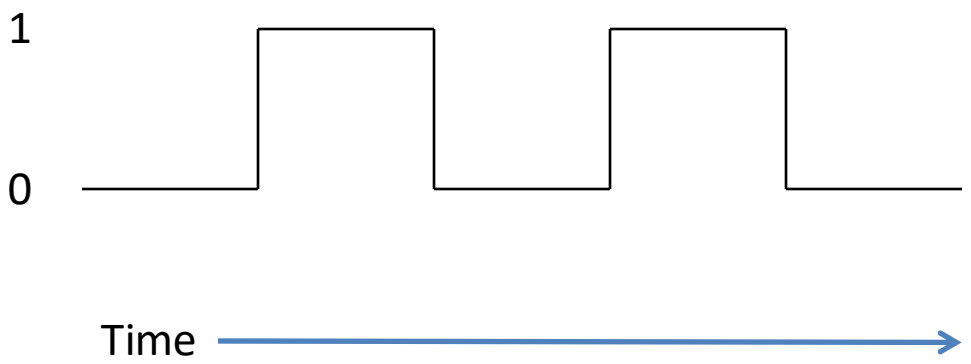
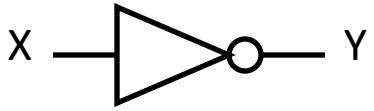
Logic Gates and Timing Diagrams

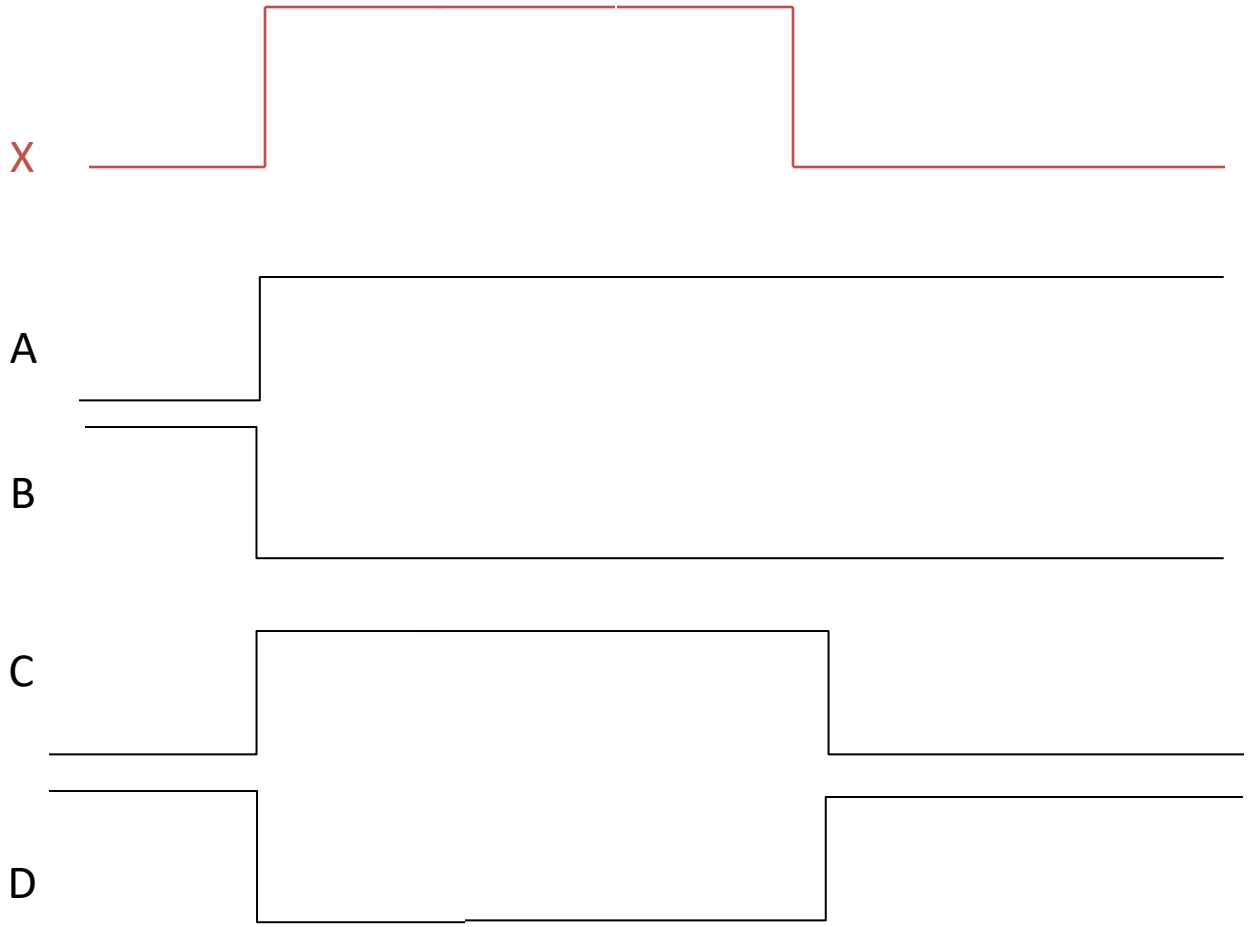


Which of the following most closely maps to Y (the output of the inverter)?



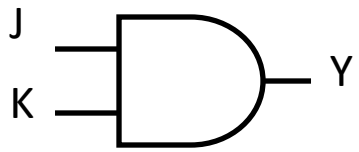
Inverter

X	Y
0	1
1	0



E None of the above.

Select the correct output for Y



AND

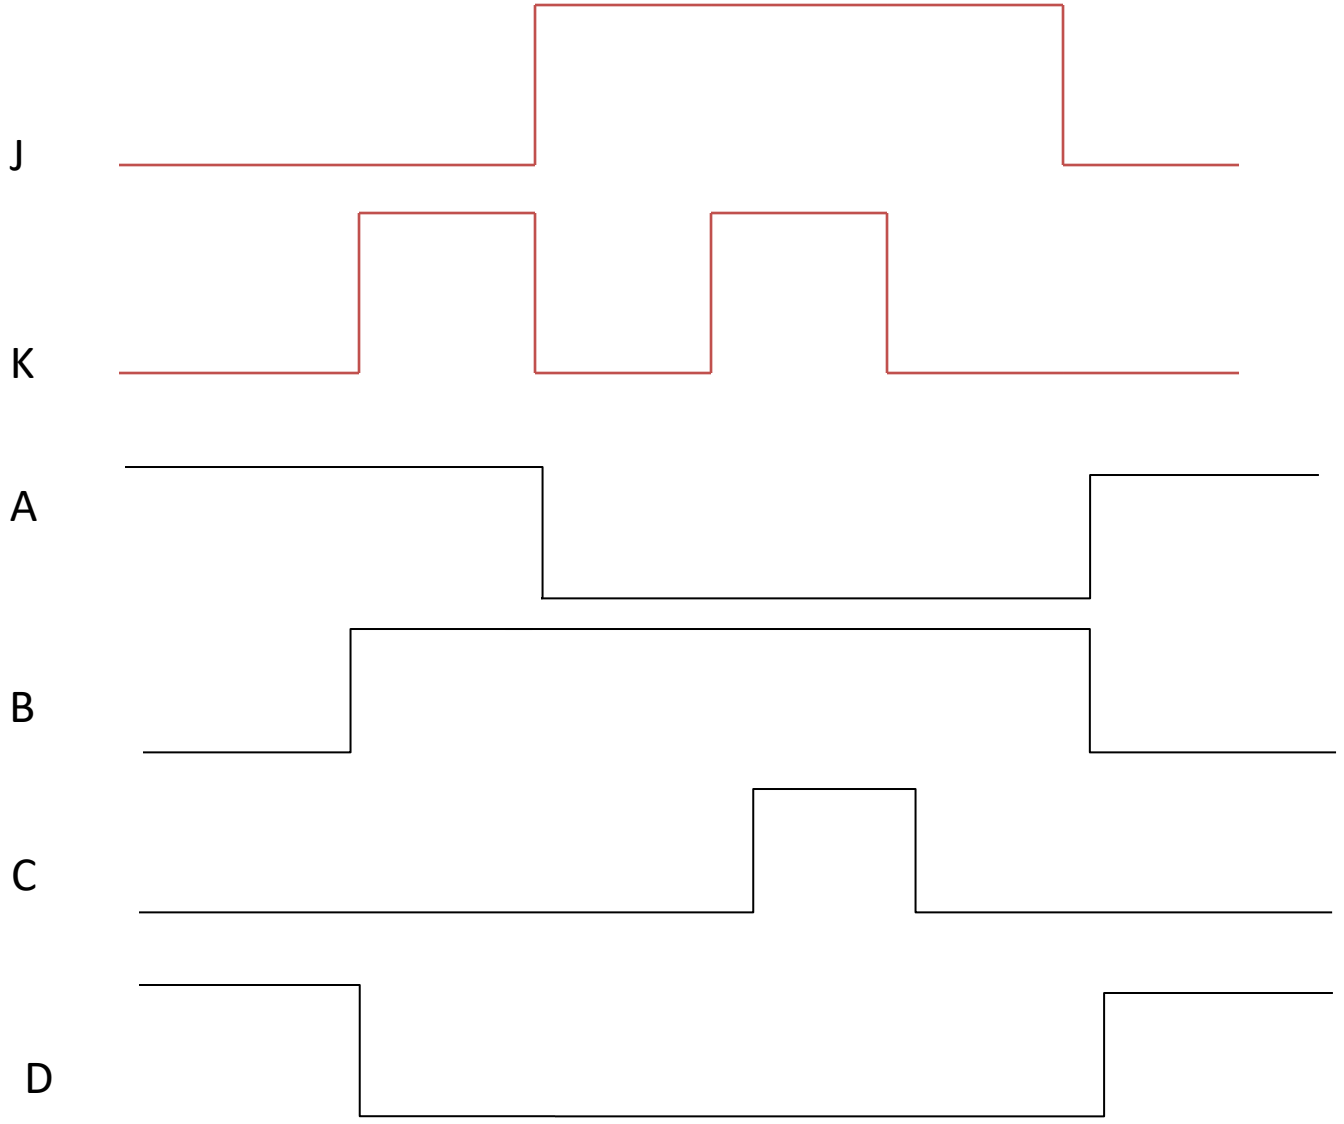
JK Y

00 0

01 0

10 0

11 1



E None of the above

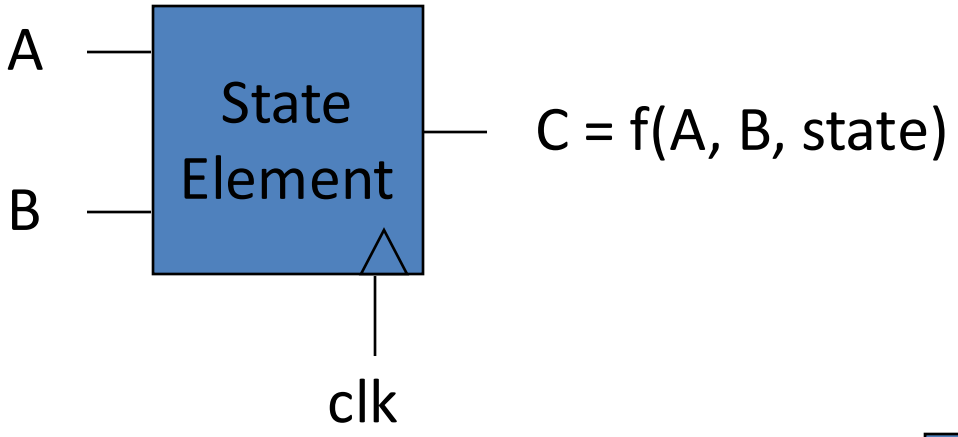
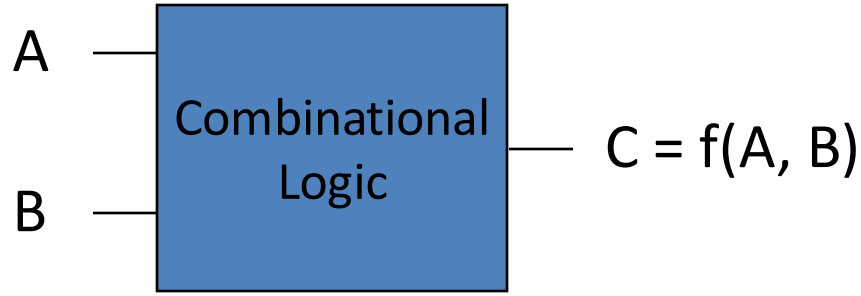
Two Types of Logic Components



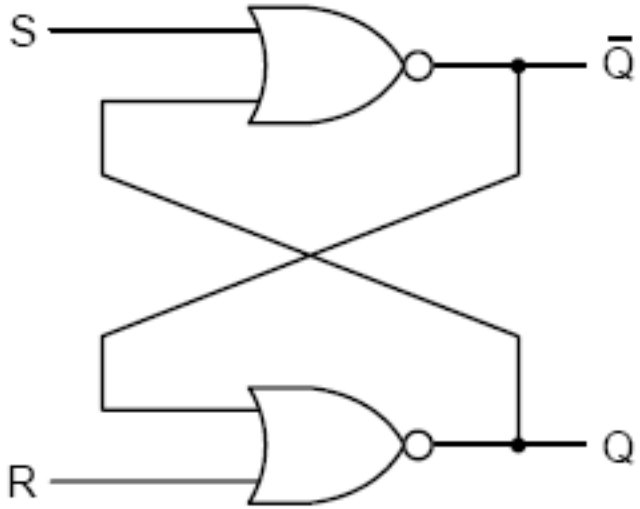


State Elements

- Output depends on input, AND a value saved inside the element

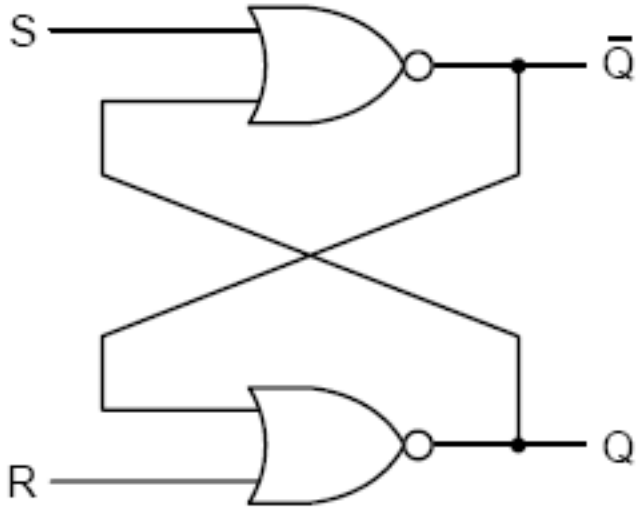
- Have *memory*

Set-Reset (S-R) Latch



- Output depends on S, R, AND previous value of Q
- Stores 1 bit of state

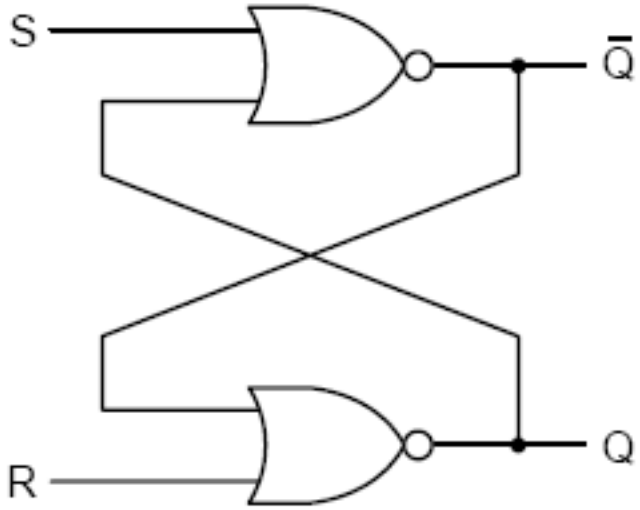
S-R Latch: S = 1, R = 0



Consider what happens when Q = 0 initially and when Q = 1 initially

	Q
A	0
B	1
C	Q from before
D	$\bar{Q}$ from before
E	None of the above

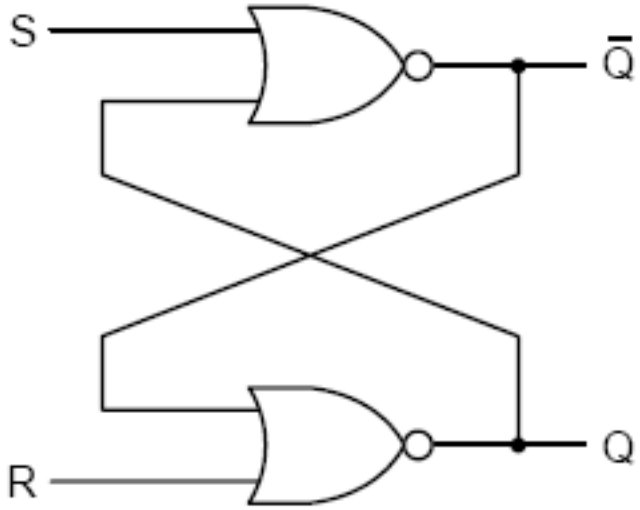
S-R Latch: S = 0, R = 1



Consider what happens when Q = 0 initially and when Q = 1 initially

	Q
A	0
B	1
C	Q from before
D	$\bar{Q}$ from before
E	None of the above

S-R Latch: S = 0, R = 0



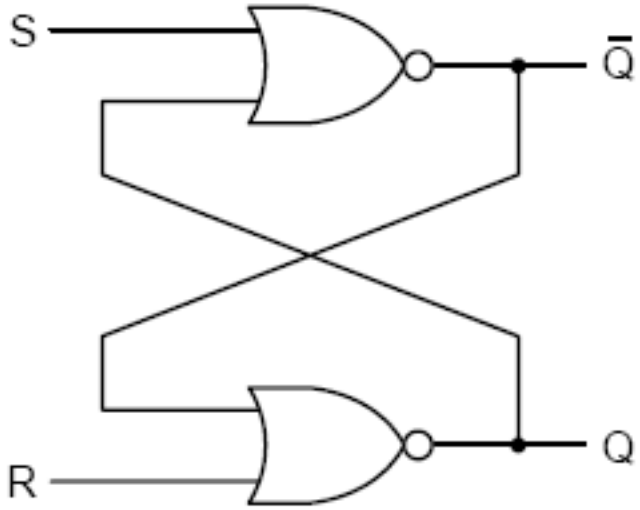
Consider what happens when Q = 0 initially and when Q = 1 initially

	Q
A	0
B	1
C	Q from before
D	$\bar{Q}$ from before
E	None of the above

S-R Latch: S = 1, R = 1

	Q	$\bar{Q}$
A	0	1
B	1	0
C	Q from before	$\bar{Q}$ from before
D	$\bar{Q}$ from before	Q from before
E	None of the above	

S-R Latch



- Set: $Q_t = 1$
- Reset: $Q_t = 0$
- Otherwise, $Q_t = Q_{t-1}$

Terminology

- The S-R latch is a **bistable multivibrator**
  - Bistable: two stable states—set $Q = 1$, $\overline{Q} = 0$ and reset $Q = 0$, $\overline{Q} = 1$
  - Monostable: one stable state, one unstable state; the circuit returns to the stable state after a short time in the unstable state
  - Astable: two unstable states and the circuit switches between them
  - Multivibrator: a digital circuit that uses feedback
    - The name comes from the first such circuit that produced a square wave which had many harmonics, hence *multivibrateur*

Clock

- Oscillates between 1 and 0 at a set rate
- Used with elements that have memory

Clocked SR Latch

- Only changes state when the clock is asserted

Given S, R and Clock, Q will be:
