CS 241: Systems Programming Lecture 2. Introduction to Unix and the Shell

Spring 2020 Prof. Stephen Checkoway

What is the shell?

Text-based interface to the operating system and to the file system

User enters commands

The shell runs the commands

Output appears on a terminal (terminal emulator)

Commands can change files/directories on the file system

Terminals/terminal emulators

DEC VT100 terminal

https://upload.wikimedia.org/wikipedia/commons/6/6f/Terminal-dec-vt100.jpg

iTerm2 terminal emulator

There are many shells

sh Bourne shell

bash Bourne again shell (the one we'll be using)

dash Light-weight Bourne shell (often named sh on Linux)

csh C shell

tcsh An improved csh

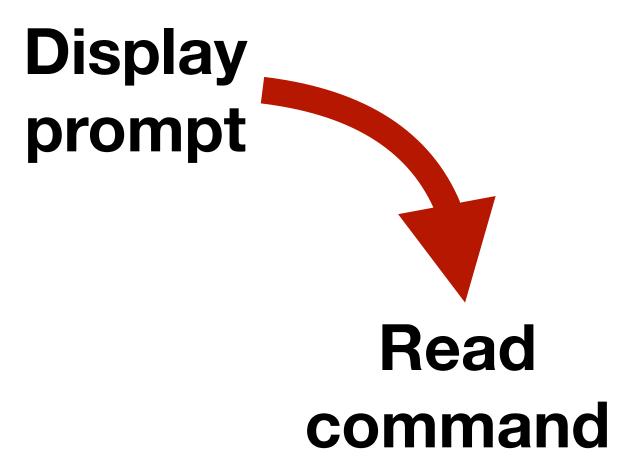

ksh Korn shell (sh-compatible, some csh features)

zsh Z shell (incorporates aspects of tcsh, ksh, and bash)

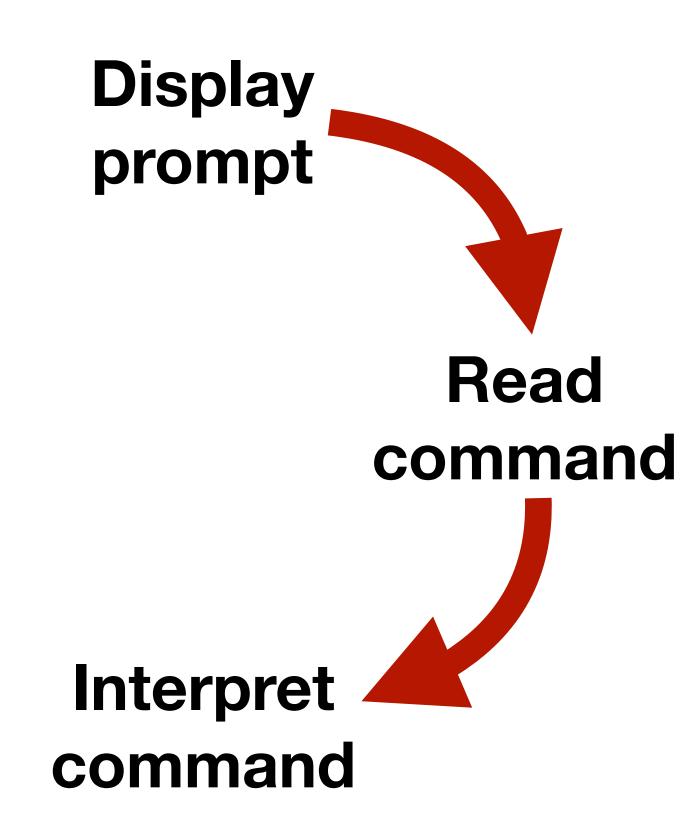

```
[worksec:~/temp] steve$
```

Display prompt

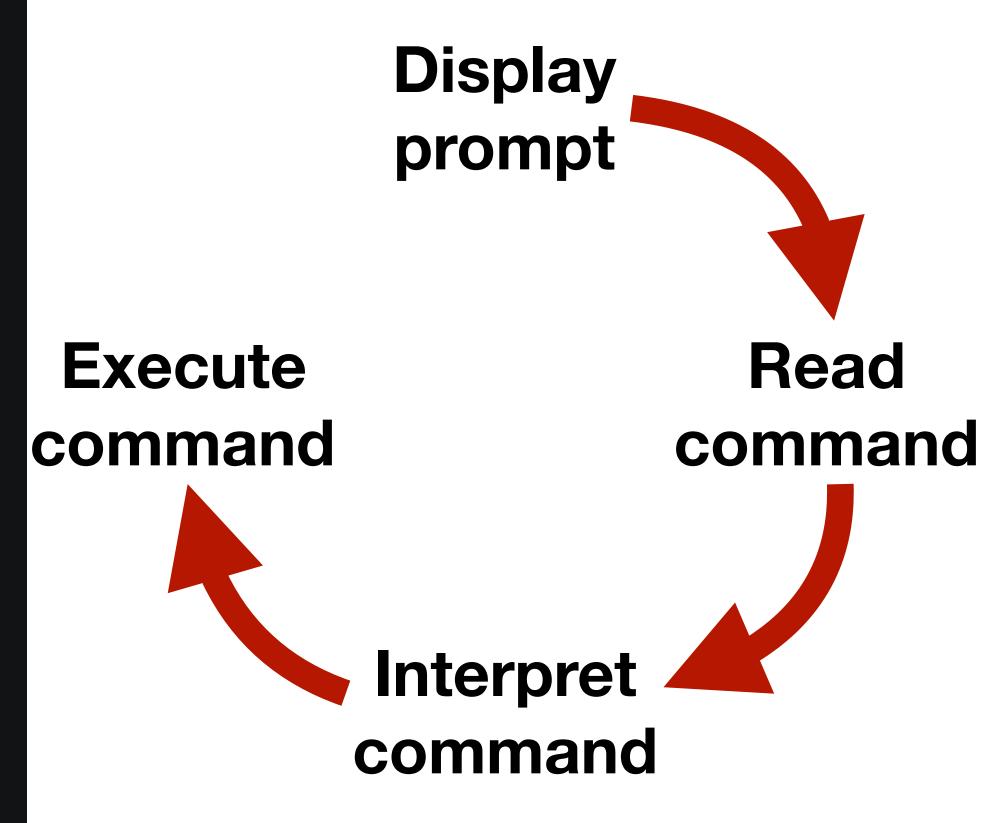

```
[worksec:~/temp] steve$ ls
```

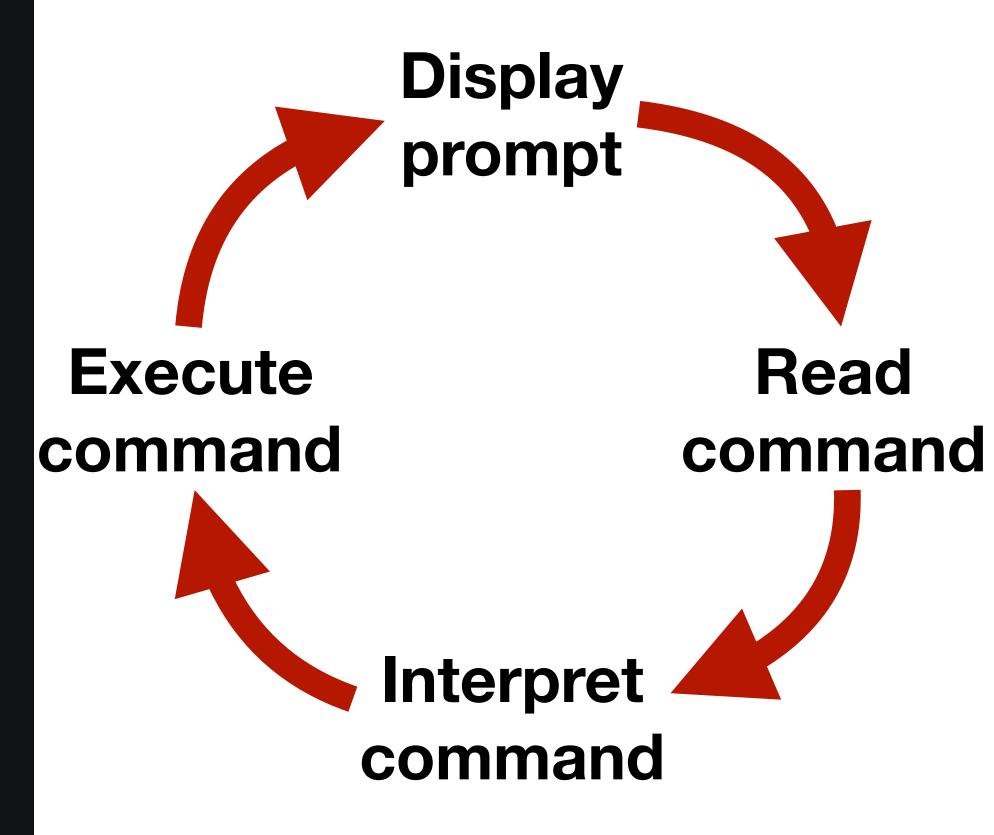

[worksec:~/temp] steve\$ ls

```
[worksec:~/temp] steve$ ls
                                                                   texput.log
                                families.log
                                                      olt.s

The file system

Structured as a single tree with root node: /

Directories hold files and directories

We name files (or directories) by giving a path through the tree

- Absolute path: /usr/bin/ssh
- Relative path (we'll come back to this)

Some important directories

```
The root directory
           Holds programs used for essential tasks (e.g., cp, mv, ls)
/bin
/sbin
           Superuser (administrator) binaries
           System-wide configuration files
/etc
           Holds programs and support files for user programs
/usr
/usr/bin User binaries
           Holds users' home directories (this is configurable)
/home
```

The current working directory

Every program on the system has its own current working directory

Not related to where the program lives in the file system

Programs can change their current working directory

The initial working directory of a running program is the current working directory of the parent—the program that launched the program

Bash's current working directory

The shell has a current directory (like every running program)

cd changes the current working directory

pwd prints the current working directory

We can name files using an absolute path or a relative path

- Absolute (starts with a /): /usr/bin/ssh
- Relative to the current working directory (doesn't start with a /)

Programs run by bash start with their initial working directory set to bash's current working directory

Example of a relative path

```
steve@clyde:~$ pwd
/usr/users/noquota/faculty/steve
steve@clyde:~$ ls /usr/bin/ssh
/usr/bin/ssh
steve@clyde:~$ cd /usr
steve@clyde:/usr$ pwd
/usr
steve@clyde:/usr$ ls bin/ssh
bin/ssh
```

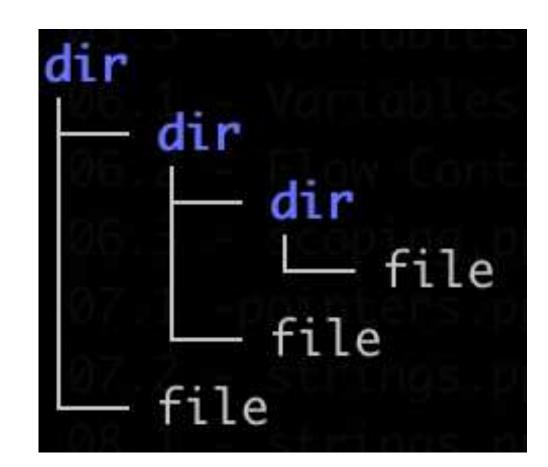

```
If we have three (poorly named) files with paths
```

```
/dir/file
/dir/dir/file
/dir/dir/file
and we run the two commands
```

- \$ cd /dir
- \$ rm dir/file
 which file is deleted?

- A. /dir/file
- B. /dir/dir/file
- C. /dir/dir/dir/file

- D. All three files
- E. None of them (e.g., because it's an error)

Two special directory entries

Two special directory entries

Each directory contains two special entries

- the directory itself (pronounced "dot")
- the directory's parent (pronounced "dot dot")

Two special directory entries

Each directory contains two special entries

- the directory itself (pronounced "dot")
- the directory's parent (pronounced "dot dot")

We can use these in paths

These all refer to the same directory

```
/usr/bin
/usr/./bin/.
/etc/../usr/bin
```

- is usually only used at the start of a relative path as ./foo
- cd .. takes us to the parent directory of the current directory
- cd ../.. takes us to the current directory's parent's parent

Which directory is listed if we run the following two commands in the shell?

```
$ cd /usr
$ ls bin/../../bin
```

- A. /
- B. /bin
- C. /usr/bin
- D. /usr/bin/bin
- E. Some other directory

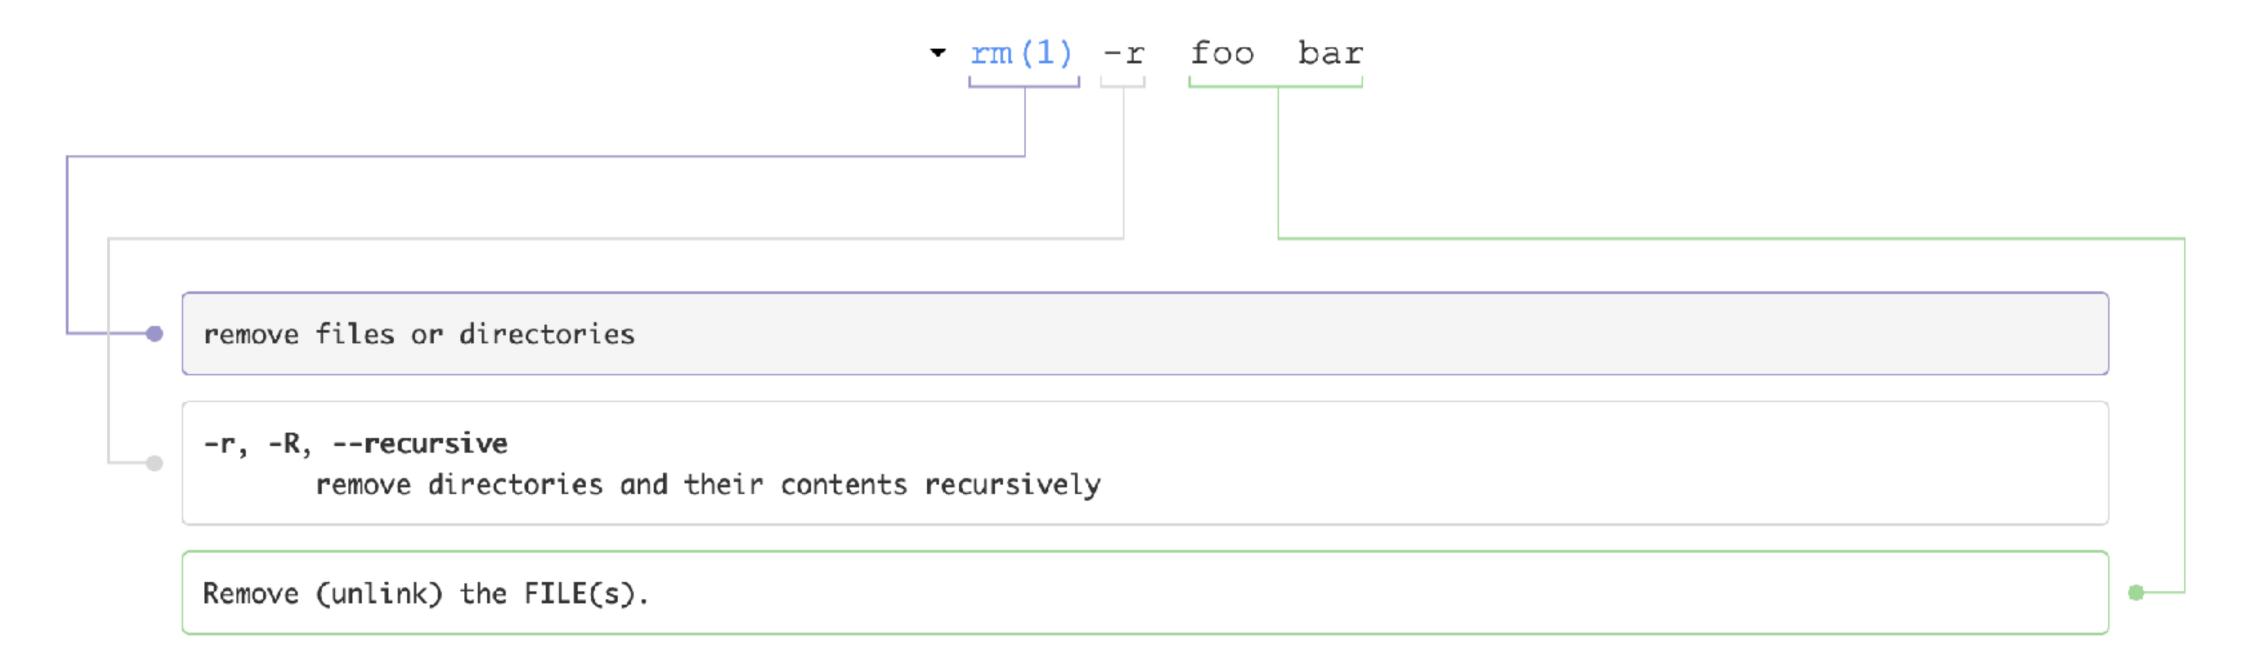

Commands

```
⟨command⟩ ⟨options⟩ ⟨arguments⟩
```

- command is the name of a command or a path to a program
- \options \are directives to the command to control its behavior
 - Usually start with one or two hyphens
- - Often file paths or server names or URLs

Example: rm -r foo bar

Example meaning

Useful commands

- ▶ Is list files
- cd change directory
- pwd print the working directory
- pushd, popd, dirs use a stack to change directories
- cp copy a file
- man show the manual page
- mv rename (move) a file
- mkdir, rmdir make or delete a directory
- rm delete a file
- chmod change file permissions

- cat concatenate files
- more, less pagers
- head, tail show first/last lines
- grep match lines
- wc count words
- tr transform characters
- split, join, cut, paste
- sort, uniq

Manual (man) pages

man is the system manual

- Use this to find out more about Unix programs
- \$ man cp

whatis show just single line information

also via \$ man -f cp

apropos search for keyword, return single lines

also via \$ man -k cp

whereis locate binary, source, man page

\$ whereis cp
cp: /bin/cp /usr/share/man/man1/cp.1.gz

Sections of the manual

Divided into sections

- 1. user commands (e.g., cp(1), ls(1), cat(1), printf(1))
- 2. system calls (e.g., open(2), close(2), rename(2))
- 3. library functions (e.g., printf(3), fopen(3), strcpy(3))
- 4. special files
- 5. file formats (e.g., ssh config(5))
- 6. games
- 7. overview, conventions, and miscellany section
- 8. administration and privileged commands (e.g., reboot (8))

Use man 3 printf to get info from section 3

You can use man -a printf to get all sections

In-class exercise

https://checkoway.net/teaching/cs241/2020-spring/exercises/Lecture-02.html

Grab a laptop and a partner and try to get as much of that done as you can!
