# CS 241: Systems Programming Lecture 3. More Shell 

Spring 2020<br>Prof. Stephen Checkoway

## Anatomy of a single command

## Anatomy of a single command

〈command〉〈options〉〈arguments〉

## Anatomy of a single command

〈command〉〈options〉〈arguments〉
－〈command〉 is the name of a command or a path to a program

## Anatomy of a single command

〈command〉〈options〉〈arguments〉

- 〈command〉 is the name of a command or a path to a program
- 〈options〉 are directives to the command to control its behavior

## Anatomy of a single command

〈command〉〈options〉〈arguments〉

- 〈command〉 is the name of a command or a path to a program
- 〈options〉 are directives to the command to control its behavior －Short options are a hyphen and a letter：－h

## Anatomy of a single command

〈command〉〈options〉〈arguments〉

- 〈command〉 is the name of a command or a path to a program
- 〈options〉 are directives to the command to control its behavior
－Short options are a hyphen and a letter：－h
－Long options are（usually）two hyphens and multiple letters：－－help

## Anatomy of a single command

$\langle c o m m a n d\rangle\langle o p t i o n s\rangle\langle a r g u m e n t s\rangle$

- 〈command〉 is the name of a command or a path to a program
- ＜options〉 are directives to the command to control its behavior
－Short options are a hyphen and a letter：－h
－Long options are（usually）two hyphens and multiple letters：－－help
－Multiple short options can be combined－a－b－c is the same as－abc

## Anatomy of a single command

〈command〉〈options〉〈arguments〉

- 〈command〉 is the name of a command or a path to a program
- ＜options〉 are directives to the command to control its behavior
－Short options are a hyphen and a letter：－h
－Long options are（usually）two hyphens and multiple letters：－－help
－Multiple short options can be combined－a－b－c is the same as－a．bc
－Options can take arguments：－o file．txt or－－output＝file．txt

## Anatomy of a single command

$\langle c o m m a n d\rangle\langle o p t i o n s\rangle\langle a r g u m e n t s\rangle$

- 〈command〉 is the name of a command or a path to a program
- ＜options〉 are directives to the command to control its behavior
－Short options are a hyphen and a letter：－h
－Long options are（usually）two hyphens and multiple letters：－－help
－Multiple short options can be combined－a－b－c is the same as－a．bc
－Options can take arguments：－o file．txt or－－output＝file．txt
－〈arguments〉 are the things the command acts on

## Anatomy of a single command

〈command〉〈options〉〈arguments〉

- 〈command〉 is the name of a command or a path to a program
- 〈options〉 are directives to the command to control its behavior
－Short options are a hyphen and a letter：－h
－Long options are（usually）two hyphens and multiple letters：－－help
－Multiple short options can be combined－a－b－c is the same as－a．bc
－Options can take arguments：－o file．txt or－－output＝file．txt
－〈arguments〉 are the things the command acts on
－Often file paths or server names or URLs

## Anatomy of a single command

$\langle c o m m a n d\rangle\langle o p t i o n s\rangle\langle a r g u m e n t s\rangle$

- 〈command〉 is the name of a command or a path to a program
- 〈options〉 are directives to the command to control its behavior
－Short options are a hyphen and a letter：－h
－Long options are（usually）two hyphens and multiple letters：－－help
－Multiple short options can be combined－a－b－c is the same as－a．bc
－Options can take arguments：－o file．txt or－－output＝file．txt
－〈arguments〉 are the things the command acts on
－Often file paths or server names or URLs
－When no arguments are given（or a single－），many commands read stdin

## Anatomy of a single command

$\langle c o m m a n d\rangle\langle o p t i o n s\rangle\langle a r g u m e n t s\rangle$

- 〈command〉 is the name of a command or a path to a program
- 〈options〉 are directives to the command to control its behavior
－Short options are a hyphen and a letter：－h
－Long options are（usually）two hyphens and multiple letters：－－help
－Multiple short options can be combined－a－b－c is the same as－a．bc
－Options can take arguments：－o file．txt or－－output＝file．txt
－〈arguments〉 are the things the command acts on
－Often file paths or server names or URLs
－When no arguments are given（or a single－），many commands read stdin
Example：tar－zcf archive．tar．gz－－verbose dir／file1 file2

## Example meaning

Shell commands

## Shell commands

Shell builtins

- Functionality built into bash (all listed in the manual)
- E.g., cd, alias, echo, pwd

## Shell commands

Shell builtins

- Functionality built into bash (all listed in the manual)
- E.g., cd, alias, echo, pwd

Shell functions

- User-defined functions (we'll get to these later)

## Shell commands

Shell builtins

- Functionality built into bash (all listed in the manual)
- E.g., cd, alias, echo, pwd

Shell functions

- User-defined functions (we'll get to these later)

## Aliases

- E.g., alias ls='ls --color=auto'

## Shell commands

Shell builtins

- Functionality built into bash (all listed in the manual)
- E.g., cd, alias, echo, pwd

Shell functions

- User-defined functions (we'll get to these later)

## Aliases

- E.g., alias ls='ls --color=auto'

Programs stored on the file system

- /bin, /usr/bin, /usr/local/bin, /sbin, /usr/sbin
- E.g., ssh, cat, ls, rm

## Pathname expansion/globbing

Bash performs pathname expansion via pattern matching (a.k.a. globbing) on each unquoted word containing a wild card

Wild cards: *, ?, [

-     * matches zero or more characters
- ? matches any one character
- [ ...] matches any single character between the brackets, e.g., [ abc ]
- [!...] or [ ${ }^{\wedge . . .] ~ m a t c h e s ~ a n y ~ c h a r a c t e r ~ n o t ~ b e t w e e n ~ t h e ~ b r a c k e t s ~}$
- [ $\mathrm{x}-\mathrm{y}$ ] matches any character in the range, e.g., [a-f ]

## Example

## Example

\$ ls ex/*.txt

| ex |  |
| :---: | :---: |
|  | a-1.bin |
|  | a-1.txt |
|  | a-2.bin |
|  | a-2.txt |
|  | a-3.bin |
|  | a-3.txt |
|  | b-1.bin |
|  | b-1.txt |
|  | b-2.bin |
|  | $b-2 . t x t$ |
|  | $b-3 . b i n$ |
|  | b-3.txt |
|  | README |

## Example

\$ ls ex/*.txt ex/a-1.txt ex/a-2.txt ex/a-3.txt ex/b-1.txt ex/b-2.txt ex/b-3.txt

| ex |  |
| :---: | :---: |
|  | - a-1.bin |
|  | $a-1 . t x t$ |
|  | a-2.bin |
|  | a-2.txt |
|  | - a-3.bin |
|  | a-3.txt |
|  | b-1.bin |
|  | b-1.txt |
|  | - b-2.bin |
|  | - b-2.txt |
|  | b-3.bin |
|  | - b-3.txt |
|  | README |

## Example

\$ ls ex/*.txt
ex/a-1.txt ex/a-2.txt ex/a-3.txt ex/b-1.txt ex/b-2.txt ex/b-3.txt
\$ ls ex/?-3.*

## Example

S IS PX/*。tXt
ex/a-1.txt ex/a-2.txt ex/a-3.txt ex/b-1.txt ex/b-2.txt ex/b-3.txt
\$ ls ex/?-3.*
ex/a-3.bin ex/a-3.txt ex/b-3.bin ex/b-3.txt

## Example

\$ ls ex/*.txt
ex/a-1.txt ex/a-2.txt ex/a-3.txt ex/b-1.txt ex/b-2.txt ex/b-3.txt
\$ ls ex/?-3.*
ex/a-3.bin ex/a-3.txt ex/b-3.bin ex/b-3.txt
\$ ls ex/[^acd]-[0-9].b*in
Ex $a-1 \cdot b i n$
$-a-1 \cdot t x t$
$-a-2 \cdot b i n$
$-a-2 \cdot t x t$
$-a-3 \cdot b i n$
$-a-3 \cdot t x t$
$-b-1 \cdot b i n$
$-b-1 \cdot t x t$
$-b-2 \cdot b i n$
$-b-2 \cdot t x t$
$-b-3 \cdot b i n$
$-b-3 \cdot t x t$
README

## Example

\$ ls ex/*.txt
ex/a-1.txt ex/a-2.txt ex/a-3.txt ex/b-1.txt ex/b-2.txt ex/b-3.txt
\$ ls ex/?-3.*
ex/a-3.bin ex/a-3.txt ex/b-3.bin ex/b-3.txt
\$ ls ex/[^acd]-[0-9].b*in
ex/b-1.bin ex/b-2.bin ex/b-3.bin

## Example

\$ ls ex/*.txt
ex/a-1.txt ex/a-2.txt ex/a-3.txt ex/b-1.txt ex/b-2.txt ex/b-3.txt
\$ ls ex/?-3.*
ex/a-3.bin ex/a-3.txt ex/b-3.bin ex/b-3.txt
\$ ls ex/[^acd]-[0-9].b*in
ex/b-1.bin ex/b-2.bin ex/b-3.bin
\$ ls "ex/*"

## Example

\$ ls ex/*.txt
ex/a-1.txt ex/a-2.txt ex/a-3.txt ex/b-1.txt ex/b-2.txt ex/b-3.txt
\$ ls ex/?-3.*
ex/a-3.bin ex/a-3.txt ex/b-3.bin ex/b-3.txt
\$ ls ex/[^acd]-[0-9].b*in
ex/b-1.bin ex/b-2.bin ex/b-3.bin
\$ ls "ex/*"
ls: cannot access 'ex/*': No such file or directory

```
NAME
```

    cp - copy files and directories
    SYNOPSIS
cp [OPTION]... [-T] SOURCE DEST
cp [OPTION] . . SOURCE... DIRECTORY
cp [OPTION]... -t DIRECTORY SOURCE ..
DESCRIPTION
Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY.

Which command copies all Java source files (those whose names end in . java) from the directory $\mathrm{a} / \mathrm{b}$ to the directory /mp?
A. \$ cp a/b/[a-z].java /top
D. \$ cp a/b/?.java
/mp
B. \$ cp a/*/*.java /top
E. \$ cp a/b /top *.java
C. $\$ \mathrm{cp} \mathrm{a} / \mathrm{b} / * . j a v a / t m p$

## Typical Unix tool behavior

\$ program

- reads from stdin, writes to stdout
\$ program file1 file2 file3
- runs 'program' on the 3 files, write to stdout
\$ program -
- For programs that require filenames, might read from stdin

## Standard input/output/error

Every running program has (by default) 3 open "files" referred to by their file descriptor number

Input comes from stdin (file descriptor 0)

- input() \# Python: Read a line
- System.in.read(var) // Java: Read bytes and store in var array
- \$ IFS= read -r var \# Read a line and store in var variable

## Standard input/output/error

## Standard input/output/error

Normal output goes to stdout (file descriptor 1)

- print(var) \# Python
- System.out. println(var) // Java
- \$ echo "\$\{var\}" \# Bash

## Standard input/output/error

Normal output goes to stdout (file descriptor 1)

- print(var) \# Python
- System. out. println(var) // Java
- \$ echo "\$\{var\}" \# Bash

Error messages traditionally go to stderr (file descriptor 2)

- print(var, file=sys.stderr) \# Python
- System.err.println(var) // Java
- \$ echo "\$\{var\}" >\&2 \# Bash

## Redirection

## Redirection

>file - redirect standard output (stdout) to file with truncation

## Redirection

>file - redirect standard output (stdout) to file with truncation
>>file - redirect stdout to file, but append

## Redirection

>file - redirect standard output (stdout) to file with truncation
>>file - redirect stdout to file, but append
<file - redirect input (stdin) to come from file

## Redirection

>file - redirect standard output (stdout) to file with truncation
>>file - redirect stdout to file, but append
<file - redirect input (stdin) to come from file

- connect stdout from left to stdin on right

## Redirection

>file - redirect standard output (stdout) to file with truncation
>>file - redirect stdout to file, but append
<file - redirect input (stdin) to come from file

- connect stdout from left to stdin on right
- $\$ \mathrm{ls} \mid \mathrm{wc}$

## Redirection

>file - redirect standard output (stdout) to file with truncation
>>file - redirect stdout to file, but append
<file - redirect input (stdin) to come from file

- connect stdout from left to stdin on right
- \$ Is | wc

2>file - redirect standard error (stderr) to file with truncation

## Redirection

>file - redirect standard output (stdout) to file with truncation
>>file - redirect stdout to file, but append
<file - redirect input (stdin) to come from file

- connect stdout from left to stdin on right
- \$ Is | wc

2>file - redirect standard error (stderr) to file with truncation
$2>\& 1 \quad$ - redirect stderr to stdout

## Redirection examples

## Redirection examples

\$ echo 'Hi!' >output.txt

## Redirection examples

\$ echo 'Hi!' >output.txt
\$ cat <input.txt

## Redirection examples

\$ echo 'Hi!' >output.txt
\$ cat <input.txt
\$ sort <input.txt >output.txt

## Redirection examples

\$ echo 'Hi!' >output.txt
\$ cat <input.txt
\$ sort <input.txt >output.txt
\$ ps -ax | grep bash

## Redirection examples

\$ echo 'Hi!' >output.txt
\$ cat <input.txt
\$ sort <input.txt >output.txt
\$ ps -ax | grep bash
\$ grep hello file | sort | uniq -c

## Redirection examples

\$ echo 'Hi!' >output.txt
\$ cat <input.txt
\$ sort <input.txt >output.txt
\$ ps -ax | grep bash
\$ grep hello file | sort | uniq -c
\$ echo Hello | cut -c 1-4 >>result.txt

## Redirection examples

\$ echo 'Hi!' >output.txt
\$ cat <input.txt
\$ sort <input.txt >output.txt
\$ ps -ax | grep bash
\$ grep hello file | sort | uniq -c
\$ echo Hello | cut -c 1-4 >>result.txt
\$ ./process <input | tail -n 4 >output

## (Almost) everything is a file

Files on the file system
Network sockets (for communicating with remote computers, e.g., web browsers, ssh, mail clients etc.)

Terminal I/O

A bunch of special files

- /dev/null - Writes are ignored, reads return end-of-file (EOF)
- /dev/zero - Writes are ignored, reads return arbitrarily many 0 bytes
- /dev/urandom - Reads return arbitrarily many (pseudo) random bytes

Given that / dev/null ignores all data written to it, how can we run the program ./foo and redirect stderr so no error messages appear in our terminal?

```
A. $ ./foo >/dev/null
B.$ ./foo 1>/dev/null
C.$ ./foo 2>/dev/null
D.$ ./foo | /dev/null
E.$ ./foo &2>/dev/null
```

Some programs read all of their input before terminating. How can we run a program ./foo such that it has no input at all?

```
A.$ ./foo </dev/null
B.$ ./foo </dev/zero
C. $ ./foo </dev/urandom
D.$ ./foo </dev/eof
E.$ echo | ./foo
```

## In-class exercise

https://checkoway.net/teaching/cs241/2020-spring/exercises/Lecture-03.html
Grab a laptop and a partner and try to get as much of that done as you can!
